My reply: "Cool thanks! Appreciate it!"

10 subscriptions

One month of RacquetIQ, agreed by Gurjot on behalf of the Dixie Squash Club.

Why it matters more than the revenue. Ten club players on real accounts is the first cohort that can tell me whether the read-out is worth anything to someone who actually plays — and it lands in the same week the paid product started working end to end.

Follow-ups now open: Quinton (club squash pro — the coaching read) and Abhi Pande (the AI read).

What a reviewer — and those ten players — will open first

The first-launch tutorial, re-shot tonight against the new green. It front-loads the two steps that can silently ruin an analysis: where the phone sits, and how the four floor corners get tapped.

1 · What it does. Four claims, no more.

2 · Film the match. "The step that decides whether the analysis is any good."

3 · Import the clip. Shrunk on the phone, then analysed on the phone.

4 · Mark the corners. A careless tap tilts the whole court.

5 · Read it. Ends on the small print, not on a boast.

Ball tracking: measured first, and then deliberately not built

Run as a gated feasibility study rather than a feature: hand-label ball positions, measure a detector against them, and only build tracking if the numbers earn it. They did not, so nothing was built — and the reason turned out to be the camera, not the algorithm.

Detection is real — chance-corrected significant at $p < 0.0005$, localising to ~2.1 px, at the floor of what the labeller could resolve. It still fails, because a bounce is an *instant* located by fitting motion either side of it, which needs about six consecutive positions spanning the event. Across 84 frames of live play there was exactly one such run.

What got built in these 24 hours

The referee calls a video's score out loud as it plays — the score is a fold of time, not a forward-only cursor: scrub back and it rewinds, and the same second always reads the same. Autopilot defaults on, so the honesty moved to the entry caption, a first-session disclosure, and a spoken line every armed session. 10ffbe5

Pose skeletons over the referee's video — the same overlay the analysis screen uses, fed by the playhead, with a legend bound to the scoreboard names. 85dfc9b

Login gates the whole app — an overlay above the tab shell, so the tabs never unmount when a session appears or goes. It holds a blank cover while a persisted session restores, rather than flashing a sign-in form at someone already signed in. c703b90

Purchases actually deliver Pro — the RevenueCat iOS key ships in the config, the store binds to the signed-in user so Pro follows the account and not the device, and the Account screen reads either entitlement. 4194868 19c3701

Delete your account, in the app — a SECURITY DEFINER RPC removes the caller's own auth user, profiles cascade, usage rows anonymise. Guideline 5.1.1(v). cbe445f

The review-facing copy tells the truth — the Library caption no longer claims the video is sent to a server when the default is on-device, the terms cover the referee's ~73% calls, and two "blockers" already fixed stopped being listed as open. 90993d9 b700554

The tab bar clears contrast — active tint moved from raw Optic (2.1:1 on the light canvas) to accent-text. It is the only affordance showing the current tab, on every screen. 90993d9

Two build bugs that would have shipped — an unanchored analysis/ in .easignore silently deleted src/features/analysis from every upload (build 27 failed on it); and four version sources disagreed, so build 28 produced a valid IPA reporting 0.1.0 that would never have attached to a 1.0 release. 2afe23d 5d61bce

The new first screen. No session, no app — the Account tab's own sign-in card, full screen, above the tab shell.

SUBMISSION CANDIDATE

EAS build 29, v1.0.0 — verified inside the IPA: distribution-signed, Apple Sign In entitlement, all four permission strings

One known gap: a generic photo-library purpose string — a 5.1.1 risk, already patched for the next build.
