

RacquetIQ — 24-Hour Build Report

Aug 16 → 17, 2026 · made by Claude · from empty analysis folder to my own match analyzed, on-device, on TestFlight

10 commits

1 PR open

TestFlight v0.1.0 (build 10)

Analysis runs on the phone — no server

Every joint of both players mapped, frame by frame — green is me (Player A), orange is my opponent.

Tracking holds through a swing and a lunge mid-rally.

My match, by the numbers

Favorite pattern: back-left, then back-left again (55% of the time). Predictability 0.57 — something for Shawn to work on with me.

The app, today. My own match on the analysis page: the video beside 10 rallies, 7.8 shots per rally, and shot placement.

Where I was on court — coverage heat maps

Player A (me) — density of where I stood, front wall at the top.

Player B (opponent) — hot zone slightly left of centre-back.

Honest small print: this clip was filmed with the phone on the floor at the front wall, so depth is squashed toward the back of the court — left/right position and the rally/shot counts are solid, front/back heat less so. Next session: film from the back-wall gallery and the full-court heat map lights up properly.

Why it matters: these maps come from the same engine that now runs entirely on the phone — pose tracking, court geometry, and shot detection with no server and no upload.

What got built in these 24 hours

- Video analysis engine built — watches a squash video and reports where each player hits, how much court they cover, and how predictable they are. [51566ad](#)
- Proven on real match footage — validated on a real 6-minute club match; results screen polished for readable heat maps and stats. [84ede9f](#) [eb9202f](#)
- Import your own match video — pick a video, tap the four court corners, get an analysis. [e03c5fc](#)
- Analysis runs entirely on the phone — no internet server needed; a cloud option stays on standby. [2f68809](#) [b48ddda](#)
- RacquetIQ name + TestFlight release — renamed and shipped to Apple TestFlight for real users. [e03c5fc](#) [4cae642](#)
- My own match analyzed — the full pipeline run on my gameplay video, results wired into the app. [098cb42](#)
- Watch the match next to the stats — the analysis page now plays the actual match video alongside the numbers. [fb79446](#)
